

TERRADAPTOR

The most versatile artificial
high directional (AHD). Available
for use in rescue and rope access.

THE ROPE HANDLING
REVOLUTION

CONTROL THE

ONLY the TerrAdaptor transitions easily between monopod, bipod, tripod, easel leg and, even quadpod configurations - with the additional Quadpod Attachment Kit.

The Incredible versatility

of the TerrAdaptor comes from the unique design of the head unit which allows the angle of each leg to be adjusted independently. This feature allows the head (and corresponding attachment points) to remain level even on very complex and uneven terrain or when set up in asymmetrical configurations that are often required in confined or complicated areas.

The Space Station adds capacity to the TerrAdaptor. Mount it to the head to increase the number and capability of attachment points. Divide it in half to create a burly monopod or attach it mid-leg to provide targeted anchor points.

The Quick Lash is ideal for attaching pulleys or other gear to assist with tie backs, redirects, and/or tie downs. With the QuickLash, TerrAdaptor™ users will now be able to install an auxiliary anchor point before, during or after set up.

Lash Ring is designed to provide multiple attach points for stabilizing the tripod. Lash rings can be installed in any position, in any quantity and in any orientation along the perf tubes.

Available in black: NFPA230107

or SMC orange: NFPA230100

Configured as a Symmetric quadpod, the TerrAdaptor provides increased strength and stability making them better for spanning large gaps or when setting up at heights above 9'. This added stability also makes them a great tool for restrictive environments like walkways and mezzanines.

Quadpod Conversion Kit sold separately (PN230105)
